Reasons for Allowance

Upon further review and consideration, none of the prior art of record teaches :

- a) the combined features of the direct connection of the central processing unit to the north gate on a single substrate, the access requests from the central processing unit to the north gate at the rate of the central processing unit, and the processing of the memory access requests at the rate of memory by the north gate (claims 1,28);
- b) the combined features of the retrieval of the memory request from the memory request buffer at the memory rate, the north bridge interfaced with the memory at memory rate, the memory bus , the north gate and memory on the same substrate (claim 14);
- c) the combined features of the issuing the memory request of the phase locked loop when instruction information is not in the data module or the instruction module, the receiving of the memory request form central processing unit at central processing rate, the retrieval of the memory access request from the memory request buffer at memory rate (claim 7,20).

Prior art of record

- a) Wandler et al. (5,991,833) disclosed a system including the north bridge [50] which may be integrated with a CPU (e.g. see col.6, lines 1-8). However, it did not show the

Art Unit: 2183

combined features of the access requests from the central processing unit to the north gate at the rate of the central processing unit and the processing of the memory access requests at the rate of memory by the north gate as claimed.

b) Connor et al. (4,152,764) was cited for the teaching of the processing of the request not to exceed the memory speed (e.g. see col.2, lines 13-27, col.5, lines 60-67).

However, Connor was directed to the sum of lower rates of the processors not to exceed the maximum storage rate. Connor did not show the memory request by the north bridge at the memory rate, nor the combined features of the combined features of the direct connection of the central processing unit to the north gate on a single substrate, the access requests from the central processing unit to the north gate at the rate of the central processing unit, and the processing of the memory access requests at the rate of memory by the north gate.
